(ABB90790-ABB94016) for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant organisms using suitable search parameters, where plant sequences having an E-value greater by a factor of 3 than the E-value of most similar non-plant are useful for identifying modulators. The identified modulators are suestle as the polypeptides or nucleic acids encoding them seeful as herbicides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to identifying target proteins (ABB90790-ABB94016) for herbicidally active compounds, comprising and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant organisms using suitable search parameters, where plant sequences having an E-value greater by a factor of 3 than the E-value of most similar non-plant sequences are selected. The polypeptides or nucleic acids encoding them are useful for identifying modulators. The identified modulators are useful as herbicides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Identifying plant target proteins for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 23, Application US/08881189B
Patent No. 6310195
GENERAL INFORMATION:
APPLICANT: Colucci et al.
TITLE OF INVENTION: NUCLEIC ACID ENCODING A LECTIN-DERIVED
TITLE OF INVENTION: PROGENITOR CELL PRESERVATION FACTOR
                                                                          GENERAL INFORMATION:
APPLICANT: Colucci et al.
TITLE OF INVENTION: NUCLEIC ACID ENCODING A LECTIN-DERIVED TITLE OF INVENTION: PROGENITOR CELL PRESERVATION FACTOR NUMBER OF SEQUENCES: 24

Jactose transport system permease protein lacF - Synechocystis sp. (strain PCC 6803)
N.Alternate names: protein s1r1202
C.Species: Synechocystis sp.
A.Variety: PCC 6803
A.Variety: PCC 6803
A.Variety: PCC 6803
C.Date: 25-Apr-1997 #sequence_revision 25-Apr-1997 #text_change 20-Jun-2000
C.Accession: S77536

-!- FUNCTION: Catalyzes the condensation of the acetyl group of acetyl-CoA with 3-methyl-2-oxobutanoate (2-oxoisovalerate) to form 3-carboxy-3-hydroxy-4-methylpentanoate (2-isopropylmalate).

-!- CATALYTIC ACTIVITY: 3-carboxy-3-hydroxy-4-methylpentanoate + COA = acetyl-CoA + 3-methyl-2-oxobutanoate + H(2)0.

-1 FUNCTION: INHEBITS THE PHOSPHORYLATION OF RHODOPSIN IN A CALCIUM-
-1 FUNCTION: INHEBITS THE PHOSPHORYLATION OF RHODOPSIN IN A CALCIUM-
-1 TISSUE SPECIFICITY: EXPRESSED IN NEURONAL TISSUES. HIGH LEVEL
EXPRESSION SEEN IN THE CORTICAL REGIONS OF THE CENTRAL BRAIN AND
LOWER LEVELS IN THE LAMINA, THE FIRST OPTIC LOBE OF THE BRAIN. IT
-1 DEVELOPMENTAL STAGE: FOUND IN THE EMBRYOS, LARVAE AND PUPAE.
-2 EXPRESSION IN THE ADULT HEADS IS HIGHER THAN IN THE BODIES.
-3 MALLARITY: TO OTHER REF. HAND CALCIUM BINDING PROTEINS, BELONGS TO
THE RECOVERIN SUBFAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

```

```
-:- FUNCTION: D-Mannose/D-Glucose-binding lectin. Mixture of 60% alpha lectin and 40% of its beta and gamma proteolytic fragments.
-:- COFACTOR: Requires calcium and manganese ions for full activity.
-:- SUBMINIT: PH-DEPENDENT HOMOIMER OF ALPHA CHAINS AT PH VALUES LOWER THAN 6.5 AND A HOMOTERAMER OF ALPHA CHAINS ABOVE THIS VALUE.
-:- TISSUE SPECIFICITY: SEED.
-:- PTM: The beta and gamma chains are produced by partial proteolytic processing of the lectin alpha chain by an asparaginyl
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      LECA_CRAFL STANDARD; PRT; 236 AA.
